

How to Solve a Two-Body Problem

Lesson Notes

Learning Outcomes

- How do you use a free-body diagram and Newton's second law to analyze and solve a two-body problem?

The Basic Approach to Solving a Two-Body Problem

The solution to a two-body problem will typically include two analyses:

- A System Analysis:** Used to determine the acceleration
- An Individual Object Analysis:** Used to determine an "internal force"

Example 1

A 2.0-kg and a 3.0-kg object are connected by a rope. A 45.0-N tension force is exerted on the 3.0-kg object to accelerate them across the rough surface ($\mu=0.20$). Determine the acceleration and the tension in Rope 2.

Step 1: System Analysis

$$m_{\text{total}} = 5.0 \text{ kg}$$

$$F_{\text{grav}} = (5.0 \text{ kg}) \cdot (9.8 \text{ N/kg})$$

$$F_{\text{grav}} = F_{\text{norm}} = 49 \text{ N}$$

$$F_{\text{frict}} = \mu \cdot F_{\text{norm}} = (0.20) \cdot (49 \text{ N}) = 9.8 \text{ N}$$

$$F_{\text{net}} = F_{\text{tens}} - F_{\text{frict}}$$

$$F_{\text{net}} = 45.0 \text{ N} - 9.8 \text{ N}$$

$$F_{\text{net}} = 35.2 \text{ N}$$

$$a = F_{\text{net}} / m_{\text{total}}$$

$$a = (35.2 \text{ N}) / (5.0 \text{ kg})$$

$$a = 7.0 \text{ m/s/s}$$

(7.04 m/s/s)

Step 2: Individual Object Analysis

Consider m_2 : $m_2 = 2.0 \text{ kg}$

$$F_{\text{grav}} = (2.0 \text{ kg}) \cdot (9.8 \text{ N/kg})$$

$$F_{\text{grav}} = F_{\text{norm}} = 19.6 \text{ N}$$

$$F_{\text{frict}} = \mu \cdot F_{\text{norm}}$$

$$F_{\text{frict}} = (0.20) \cdot (19.6 \text{ N}) = 3.92 \text{ N}$$

$$a_{\text{system}} = a_2 = 7.04 \text{ m/s/s}$$

$$F_{\text{net}} = m_2 \cdot a_2$$

$$F_{\text{net}} = (2.0 \text{ kg}) \cdot (7.04 \text{ m/s/s})$$

$$F_{\text{net}} = 14.08 \text{ N}$$

$$F_{\text{net}} = F_{\text{tens-2}} - F_{\text{frict}}$$

$$14.08 \text{ N} = F_{\text{tens-2}} - 3.92 \text{ N}$$

$$F_{\text{tens-2}} = 14.08 \text{ N} + 3.92 \text{ N}$$

$$F_{\text{tens-2}} = 18 \text{ N}$$

Example 2

A 5.0-kg and 10.0-kg object are connected by a rope. A second rope is used to exert 225-N of force on the 10.0-kg object. Determine the acceleration and tension in the lower rope.

Step 1: System Analysis

$$m_{\text{total}} = 15.0 \text{ kg}$$

$$F_{\text{grav}} = (15.0 \text{ kg}) \cdot (9.8 \text{ N/kg})$$

$$F_{\text{grav}} = 147 \text{ N}$$

$$F_{\text{net}} = F_{\text{tens-1}} - F_{\text{grav}}$$

$$F_{\text{net}} = 225 \text{ N} - 147 \text{ N}$$

$$F_{\text{net}} = 78 \text{ N}$$

$$a = F_{\text{net}} / m$$

$$a = (78 \text{ N}) / (15 \text{ kg})$$

$$a = 5.2 \text{ m/s/s}$$

Step 2: Individual Object Analysis

Consider m_2 : $m_2 = 5.0 \text{ kg}$

$$F_{\text{grav}} = (5.0 \text{ kg}) \cdot (9.8 \text{ N/kg})$$

$$F_{\text{grav}} = 49 \text{ N}$$

$$a_{\text{system}} = a_2 = 5.2 \text{ m/s/s}$$

$$F_{\text{net}} = m \cdot a$$

$$F_{\text{net}} = (5.0 \text{ kg}) \cdot (5.2 \text{ m/s/s})$$

$$F_{\text{net}} = 26 \text{ N}$$

$$F_{\text{net}} = F_{\text{tens-2}} - F_{\text{grav}}$$

$$26 \text{ N} = F_{\text{tens-2}} - 49 \text{ N}$$

$$F_{\text{tens-2}} = 75 \text{ N}$$
